EXPERIMENT 02

VEHICLE SERVICE REQUEST MANAGEMENT SYSTEM

Zoho Creator Setup, Workspace Exploration and Application Planning

Prepared By	Suhritha Sri
Department	Computer Science and Business Systems (CSBS)
Roll Number	241401110
Platform	Zoho Creator

241401110

A practical exercise documenting the setup and exploration of a low-code workspace for planning a service-request application for an automobile service centre.

1. INTRODUCTION

The Vehicle Service Request Management System is intended to organize how an automobile service centre receives and tracks customer requests. The application concept brings customer contact details, vehicle identification, reported issues, requested services, and appointment preferences into one structured workflow. Zoho Creator provides a low-code environment in which forms, reports, application settings, and deployment options can be configured with limited manual coding.

This experiment focuses on preparing the Zoho Creator workspace and exploring the main areas needed to develop the proposed application. The screenshots retained from the reference document are included as platform evidence, while the explanations and report content are rewritten for the vehicle-service scenario.

2. AIM

To explore the Zoho Creator development environment and establish the application workspace for a Vehicle Service Request Management System.

3. OBJECTIVES

• Understand the role of a low-code platform in developing a service-request application.

• Explore the application dashboard and the main Develop, Deploy, and Manage areas.

• Identify where forms and reports can be created to capture and review vehicle-service requests.

• Review environment, mobile, portal, organization, governance, metrics, operations, and billing options.

• Plan a simple workflow from customer request submission to service-centre review and appointment coordination.

241401110

4. PROCEDURE

STEP	ACTION PERFORMED
1	Open Zoho Creator and sign in or register for an account.
2	Open the Creator console and review the application dashboard.
3	Create or plan an application named Vehicle Service Request Management System.
4	Review the application-development area where forms, reports, and pages can be configured.
5	Explore deployment options such as environments, mobile access, and portals.
6	Review organization and governance settings relevant to user access and application administration.
7	Inspect metrics and operations areas for monitoring and administration.
8	Record how the platform modules can support the planned service-request workflow.

5. APPLICATION WORKFLOW OVERVIEW

The planned application follows a straightforward flow: a customer submits a service request; the service centre reviews vehicle and issue details; staff confirm the service type and preferred appointment; and the request is tracked through a report for follow-up.

Customer Enters request	**Service Request Form** Stores vehicle and issue details	**Service Centre** Reviews and schedules	**Request Report** Tracks submitted records

Figure 1. Proposed high-level flow for handling vehicle service requests.

6. PLATFORM ARCHITECTURE

The Creator console groups tools by purpose. For this project, the development area is the primary workspace for preparing the request form and linked report; deployment and management options become relevant as the application is tested and administered.

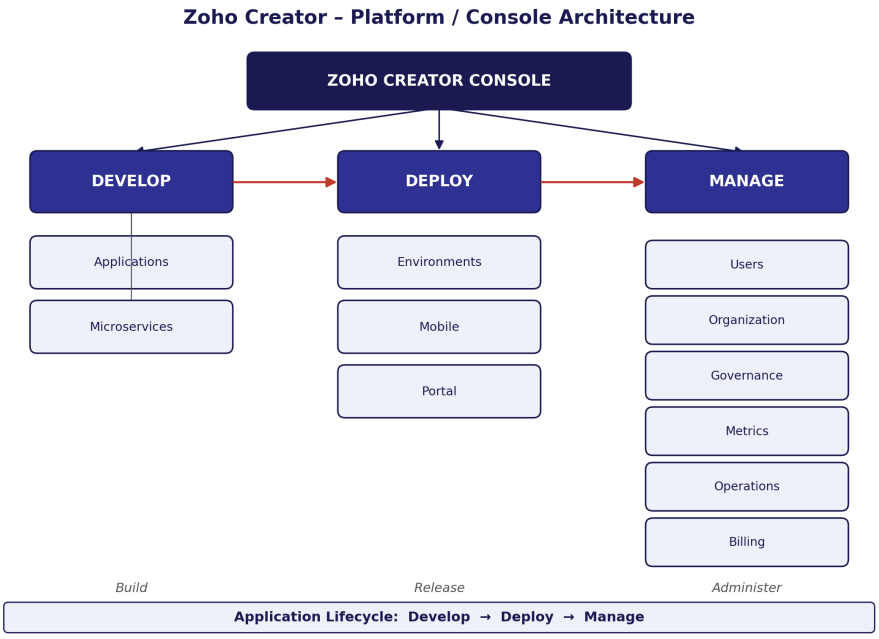

Figure 2. Platform architecture overview from the reference workspace.

Project relevance: the platform view helps identify where this function would fit during development and administration of the Vehicle Service Request Management System.

7. APPLICATION DASHBOARD

The application dashboard is the starting point for opening or creating applications. The proposed Vehicle Service Request Management System would be maintained here before its forms and report views are configured.

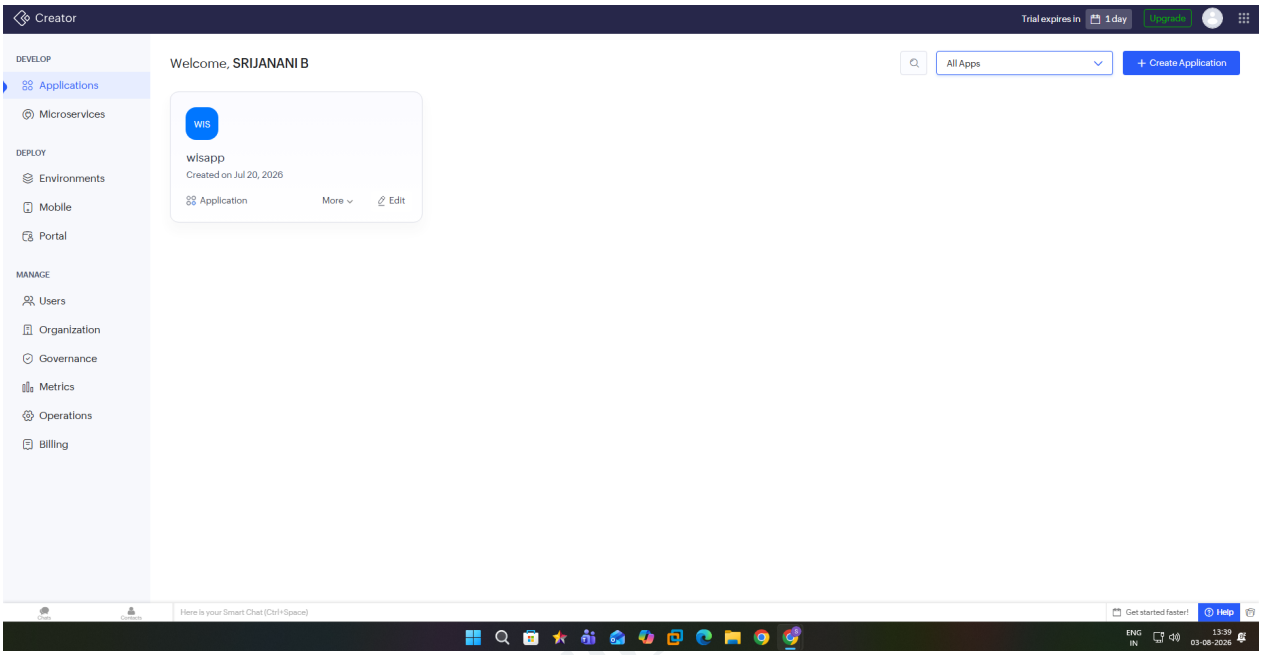

Figure 3. Application dashboard used to access application projects.

Project relevance: the platform view helps identify where this function would fit during development and administration of the Vehicle Service Request Management System.

8. MICROSERVICES AREA

The Microservices section provides a place to work with reusable integration components. It may be considered later if the service-request application needs to connect to messaging, payment, or external vehicle-related services.

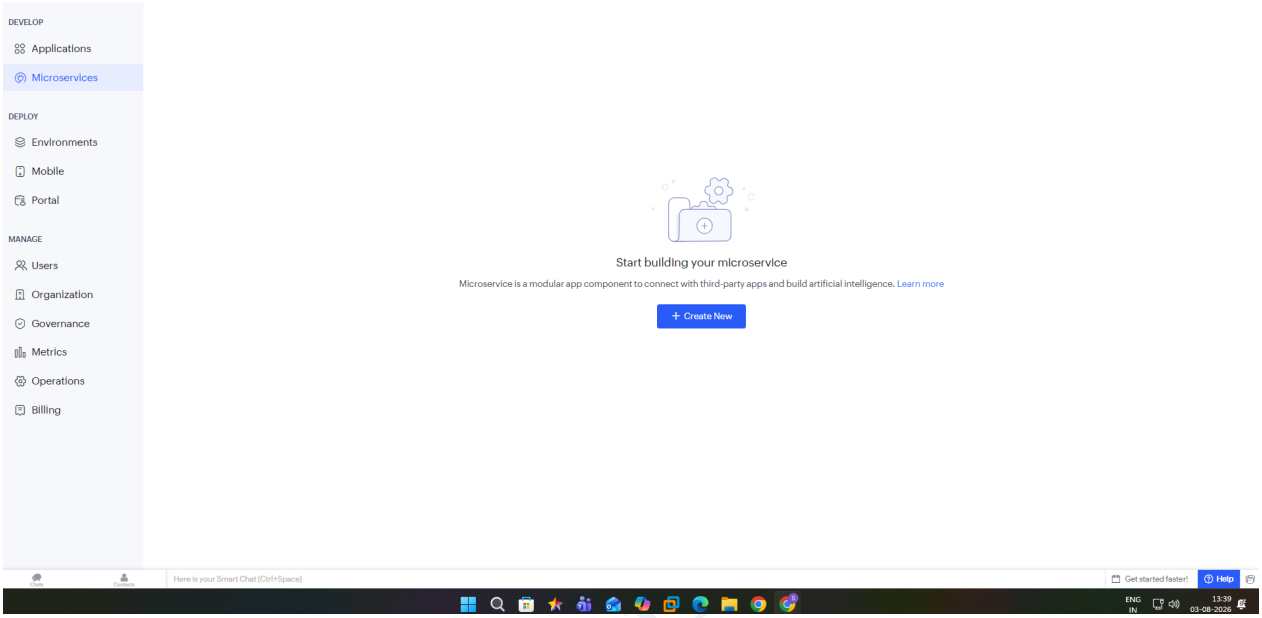

Figure 4. Microservices area in the Creator console.

Project relevance: the platform view helps identify where this function would fit during development and administration of the Vehicle Service Request Management System.

9. ENVIRONMENT SETUP

Environment management supports separating development and production work. A service centre can use a test environment to verify request fields and report behavior before releasing changes to the live application.

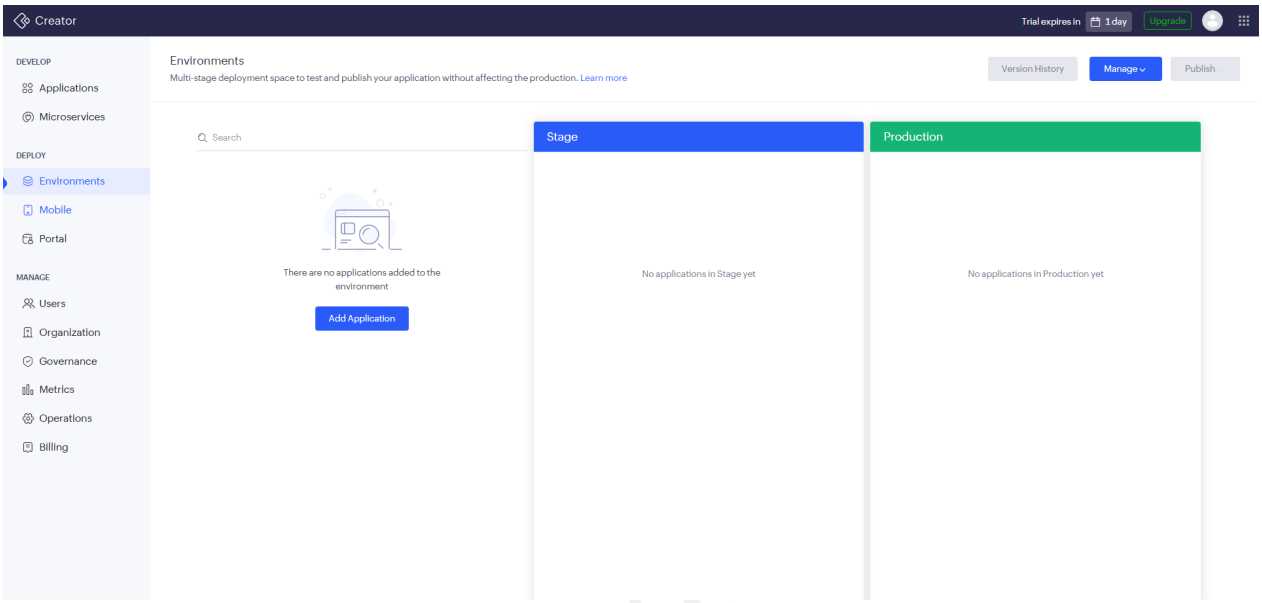

Figure 5. Environment management options.

Project relevance: the platform view helps identify where this function would fit during development and administration of the Vehicle Service Request Management System.

10. MOBILE ACCESS

Mobile distribution is useful when staff need to review requests away from a desktop. A mobile-friendly experience can help service advisors check vehicle details and appointment preferences while assisting customers.

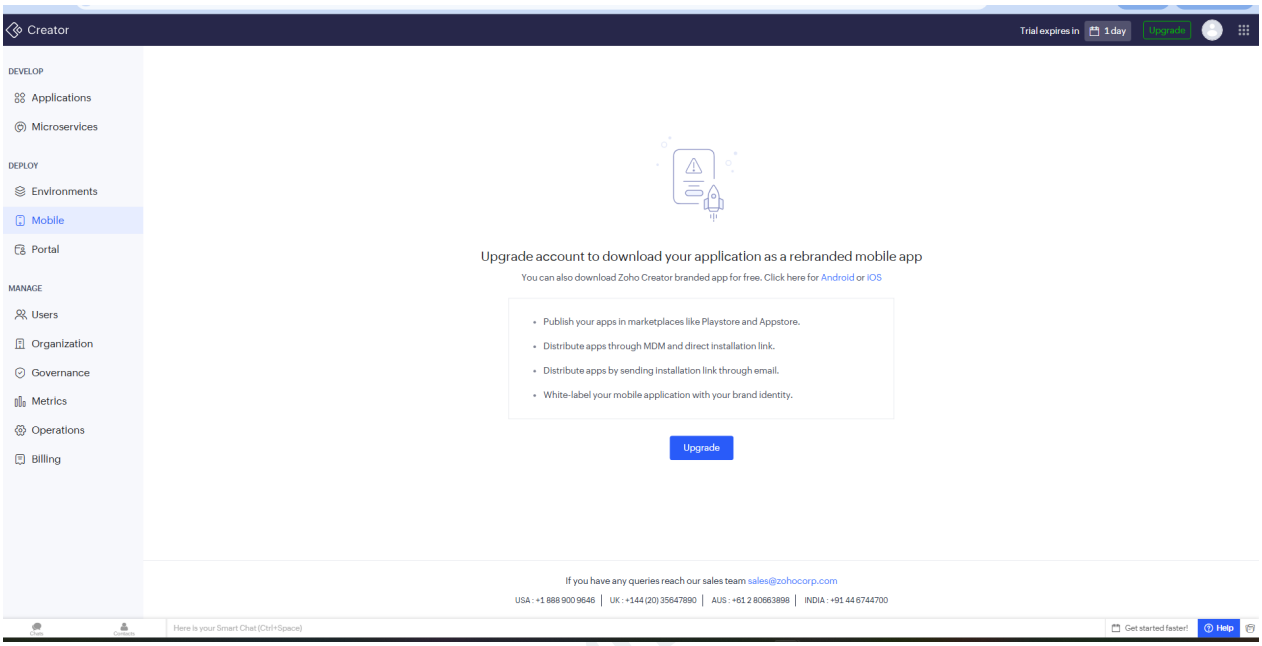

Figure 6. Mobile application distribution options.

Project relevance: the platform view helps identify where this function would fit during development and administration of the Vehicle Service Request Management System.

11. PORTAL ACCESS

A portal can provide controlled access for external users. In a future version, a customer portal could allow customers to submit service requests or review request status, subject to the application's access rules.

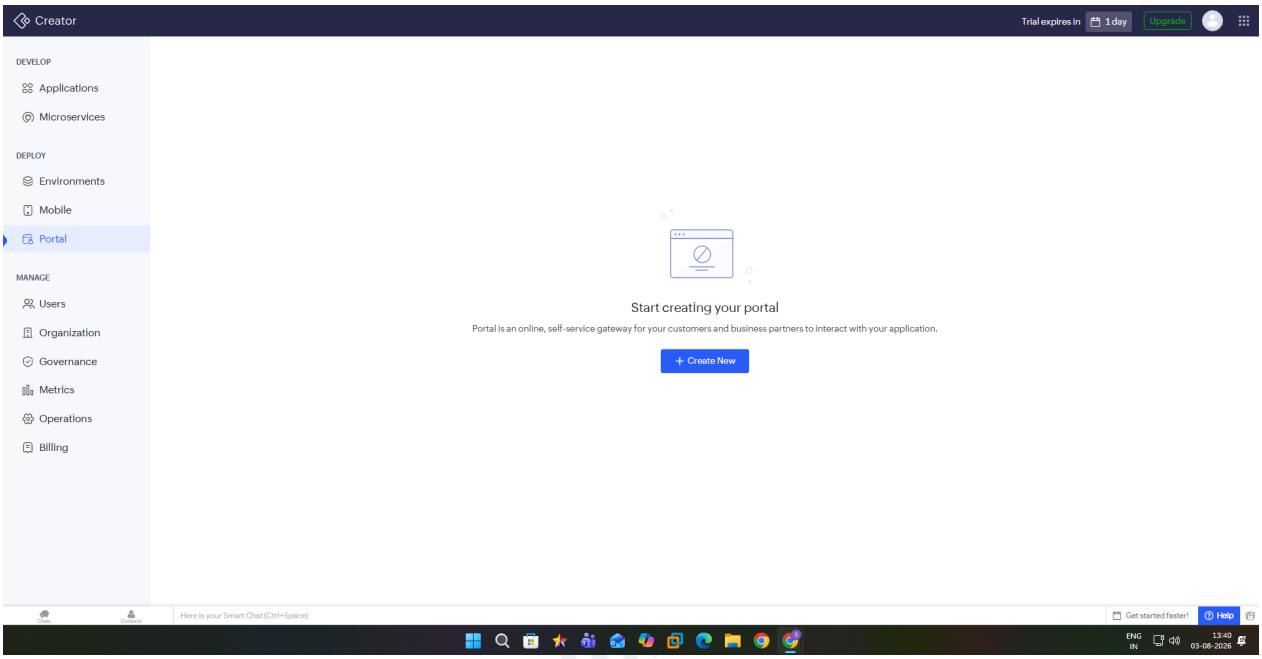

Figure 7. Portal setup area.

Project relevance: the platform view helps identify where this function would fit during development and administration of the Vehicle Service Request Management System.

12. ORGANIZATION SETTINGS

Organization settings contain account-level and administrative preferences. These settings help keep the application workspace aligned with the service centre's ownership and administration requirements.

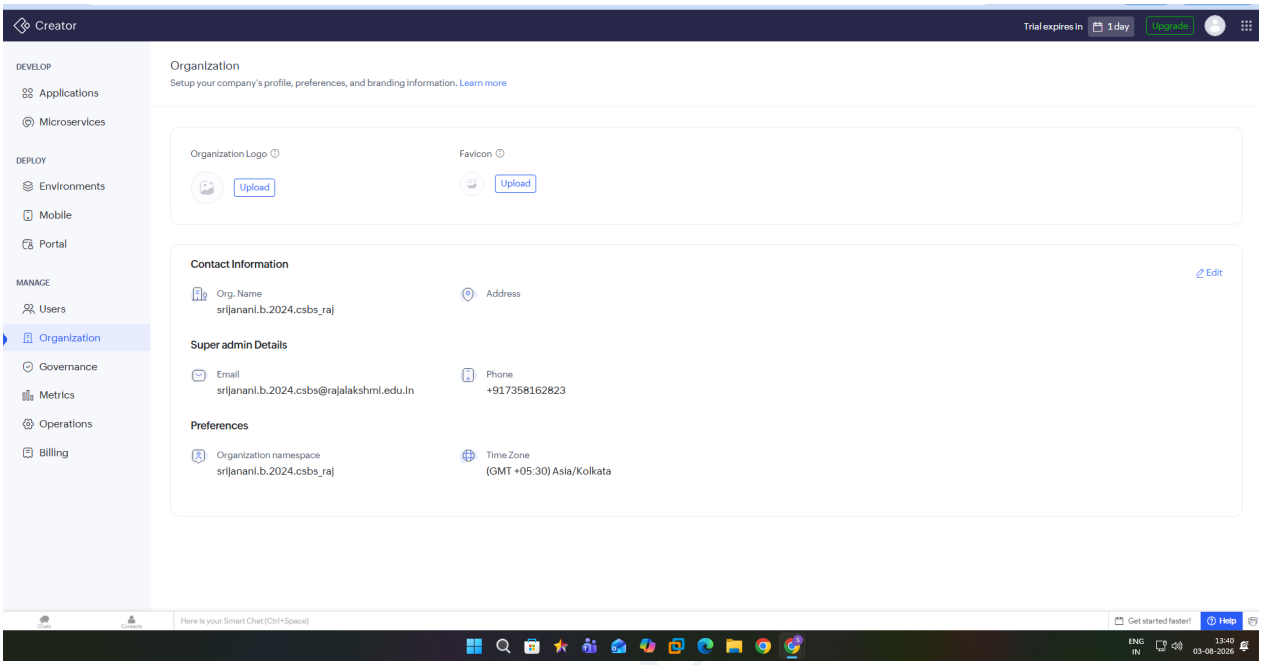

Figure 8. Organization settings within the platform.

Project relevance: the platform view helps identify where this function would fit during development and administration of the Vehicle Service Request Management System.

13. GOVERNANCE AND SECURITY

Governance options relate to security policies and access controls. For a service-request application, access should be limited according to user responsibilities so that customer and vehicle information is handled appropriately.

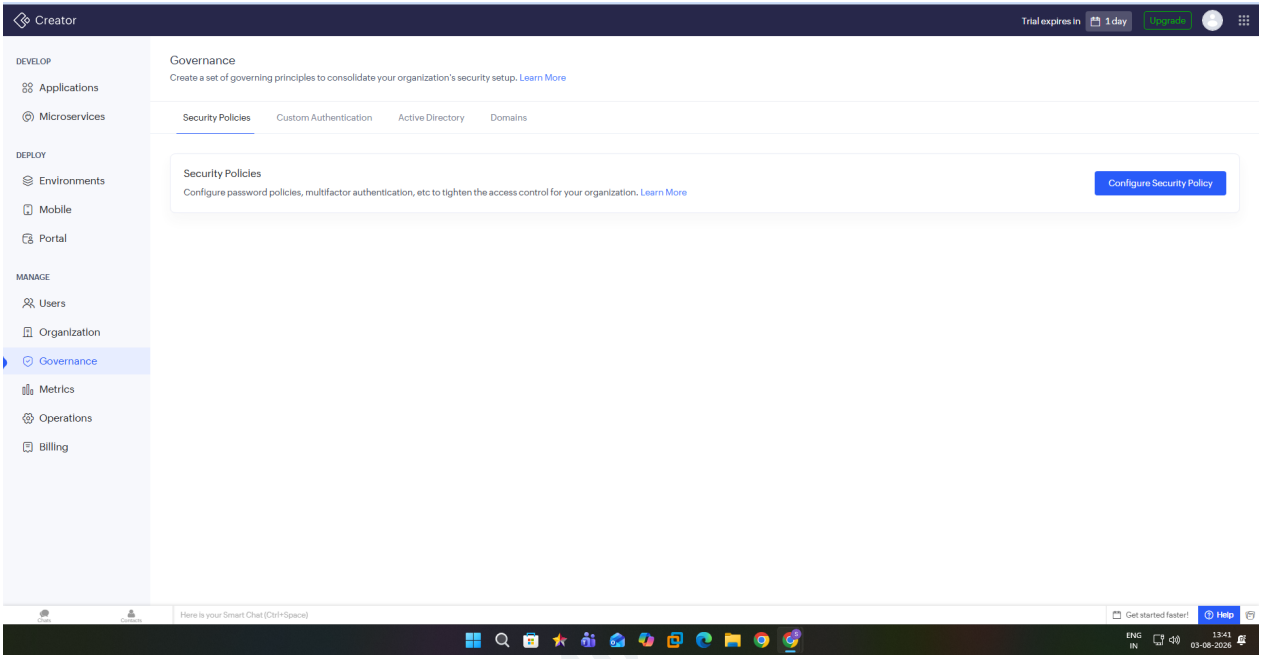

Figure 9. Governance and security-policy settings.

Project relevance: the platform view helps identify where this function would fit during development and administration of the Vehicle Service Request Management System.

14. METRICS AND OPERATIONS

Metrics and operations provide administrative visibility into platform usage and operational details. These areas can help administrators understand application activity and maintain a stable workspace as service requests increase.

Project relevance: the platform view helps identify where this function would fit during development and administration of the Vehicle Service Request Management System.

15. BILLING AND SUBSCRIPTION

Billing and subscription settings show account-plan information. Before deploying the application for regular service-centre use, the owner should check the plan's limits and confirm that the chosen features are supported.

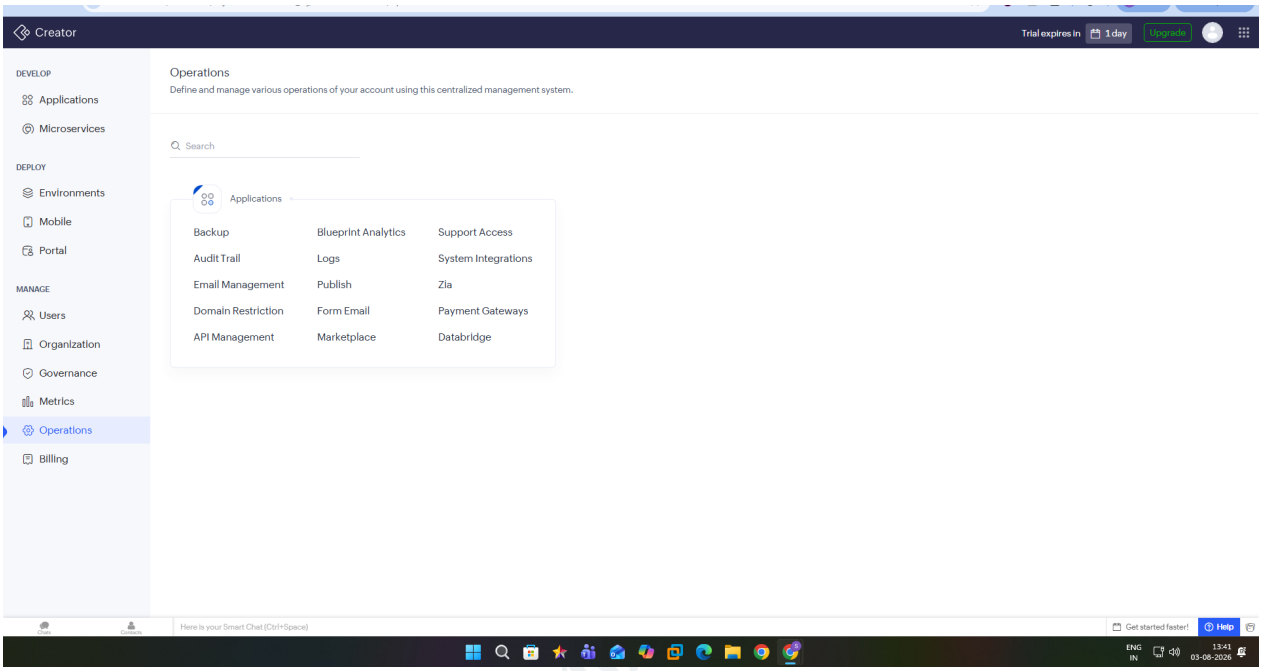

Figure 11. Billing and subscription settings.

16. EXPECTED APPLICATION STRUCTURE

The initial application can be organized around a Service Request form and a linked report. The form is expected to capture the owner's name, contact information, vehicle registration number, vehicle type, odometer reading, reported issue, requested service, and preferred date and time. The report can then be used by service staff to review requests and coordinate the next action.

FORM AREA	PURPOSE
Customer details	Identify the owner and provide a reliable way to contact them.
Vehicle details	Record registration number, vehicle type, and odometer reading.
Service request	Describe the issue and select the requested service or additional work.
Appointment preferences	Capture the preferred service date and drop-off time.
Linked report	Allow staff to view, filter, and follow up submitted requests.

17. RESULT

The Zoho Creator workspace and its major development, deployment, and administration areas were reviewed in the context of a Vehicle Service Request Management System. The experiment established a practical application plan in which a structured service-request form captures customer and vehicle details, while a linked report supports review and appointment coordination. The platform provides a low-code foundation for implementing and refining this workflow.

241401110

18. CONCLUSION

This experiment provided an overview of the Zoho Creator environment and mapped its main modules to the needs of an automobile service centre. The next implementation stage is to build and validate the service-request form, configure the report, and test the complete request flow before deployment.
