ZOHO CREATOR • CONNECTIONS • CALENDAR INTEGRATION

# 1. Aim

Toconnectthe Vehicle Service & Repair Request Management application in Zoho Creator with Zoho Calendar by creating an authorized connection and using a Deluge script to call the calendar service. When a vehicle owner successfully submits a service request, the workflow automatically createsa calendar event and reduces manual appointment scheduling.

# 2. Procedure

### Step 1 — Open Microservices

From the Develop menu in Zoho Creator, open Microservices and select Create New to configure a service connection.

### Step 2 — Select Connections

Choose Connections from the available microservice options to establish communication between the application and Zoho Calendar.

### Step 3 — Configure the Calendar Connection

Create a connection named ***vehicle_service_calendar*** and select the required authorization and access permissions for creating calendar events.

### Step 4 — Authorize Access

Review the permissions requested by Zoho Creator and authorize access to Zoho Calendar.

### Step 5 — Enable the Connection

Enable the created calendar connection for the Vehicle Service & Repair Request Management application so Deluge scripts can use it.

### Step 6 — Create a Workflow

Create a workflow for ***Service_Request_Form*** and configure it to run when a record is created after a successful form submission.

### Step 7 — Add the Deluge Script

Add a Deluge script to the workflow. Retrieve the registration number, service type, preferred service date, and preferred drop-off time from the submitted request and use them to prepare the calendar event.

### Step 8 — Save and Test

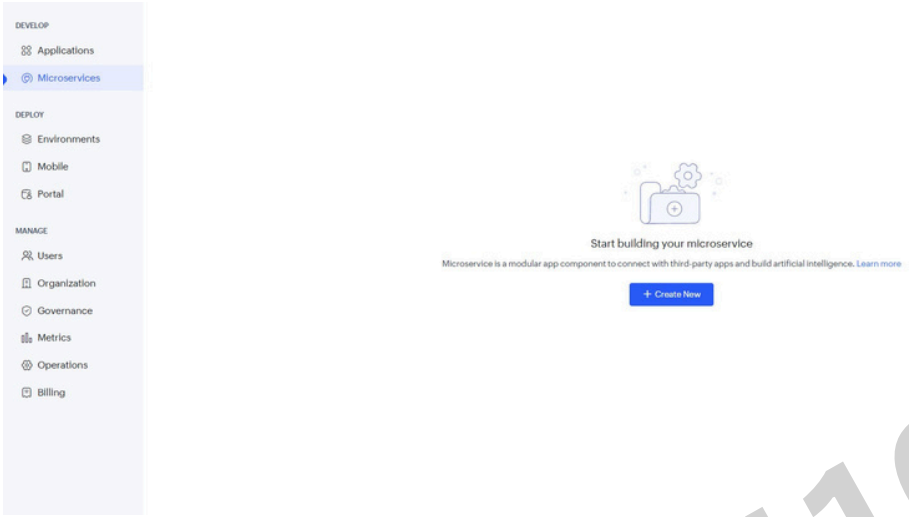

Save the script and workflow, submit a sample request through the live form, and check Zoho Calendar to confirm that the corresponding service event was created.

## 3. Output and Verification

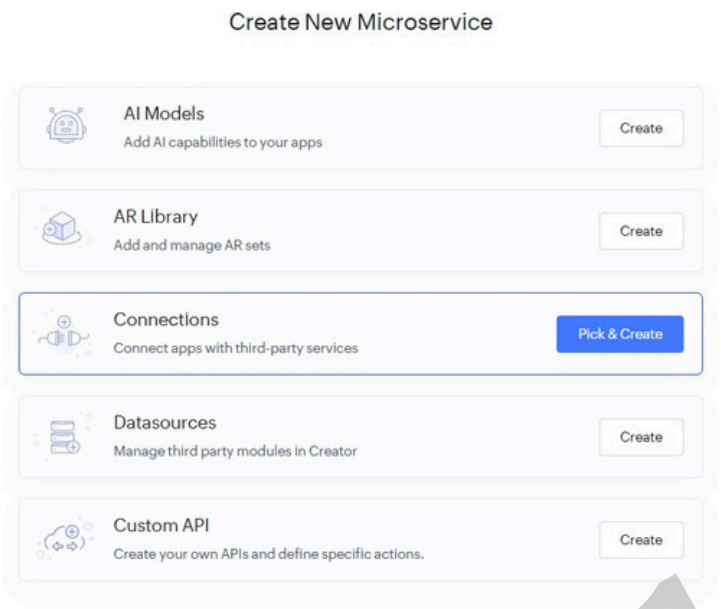

Thescreenshotsbelowdocument the connection setup, authorization, workflow configuration, Deluge script, and testing of the Zoho Calendar integration.

## *4. Final Result*

TheVehicleService &Repair Request Management application was integrated with Zoho Calendar using Connections and Deluge scripting. After a vehicle owner successfully submits a service request, the configured workflow creates a corresponding calendar event using the submitted appointment details.

This integration helps the service centre organize schedules, track upcoming appointments, and reduce manual calendar entries. The objective of integrating a Zoho Creator application with another Zoho service using Connections, APIs, and Deluge scripting was achieved.
