EXPERIMENT 11

DEPLOYING A ZOHO CREATOR APPLICATION FROM DEVELOPMENT TO PRODUCTION

VEHICLE SERVICE REQUEST MANAGEMENT SYSTEM

LAB RECORD

APPLICATION

Vehicle_Service_Request_Management_System

PLATFORM

Zoho Creator

SUBJECT

Low Code Application Development using Zoho Creator

A practical record of controlled application release and verification

1. Aim and Application Overview

Aim

To deploy the Vehicle_Service_Request_Management_System application through the Development, Stage, and Production environments in Zoho Creator. The process demonstrates how changes to vehicle service forms, reports, and workflows can be reviewed and verified before the approved version is released to end users.

Introduction

Application deployment is the controlled movement of an application version from development into a review environment and then into the live environment. Separating these environments helps prevent unfinished changes from affecting service staff or vehicle owners.

Application Modules

Module	Purpose
Vehicle and customer details	Stores vehicle registration, customer contact information, and vehicle model.
Service request form	Captures service type, issue description, preferred date, and priority.
Request status report	Allows staff to review requests by status, date, and registration number.
Workflow notifications	Supports notifications when a request is submitted or updated.
Deployment environments	Separates development work, pre-release review, and live use.

2. Deployment Model and Dashboard

The application moves through three environments. Development is used to build and modify the app, Stage is used to test a selected release, and Production contains the approved version for day-to-day use.

Figure 1. Illustrative Zoho Creator-style environment screen for the Vehicle Service Request Management System.

Environment roles

Environment	Purpose	Expected state
Development	Build forms, reports, and workflows.	Changes may be available.
Stage	Review and test selected components.	Reviewed release candidate.
Production	Serve end users and service staff.	Approved live version.

3. Vehicle Service Request Form

The service request form records the information needed to identify the vehicle, contact the customer, and understand the requested work. The example below is an illustrative interface mockup created for this lab record; it is not a screenshot captured from a live Zoho Creator account.

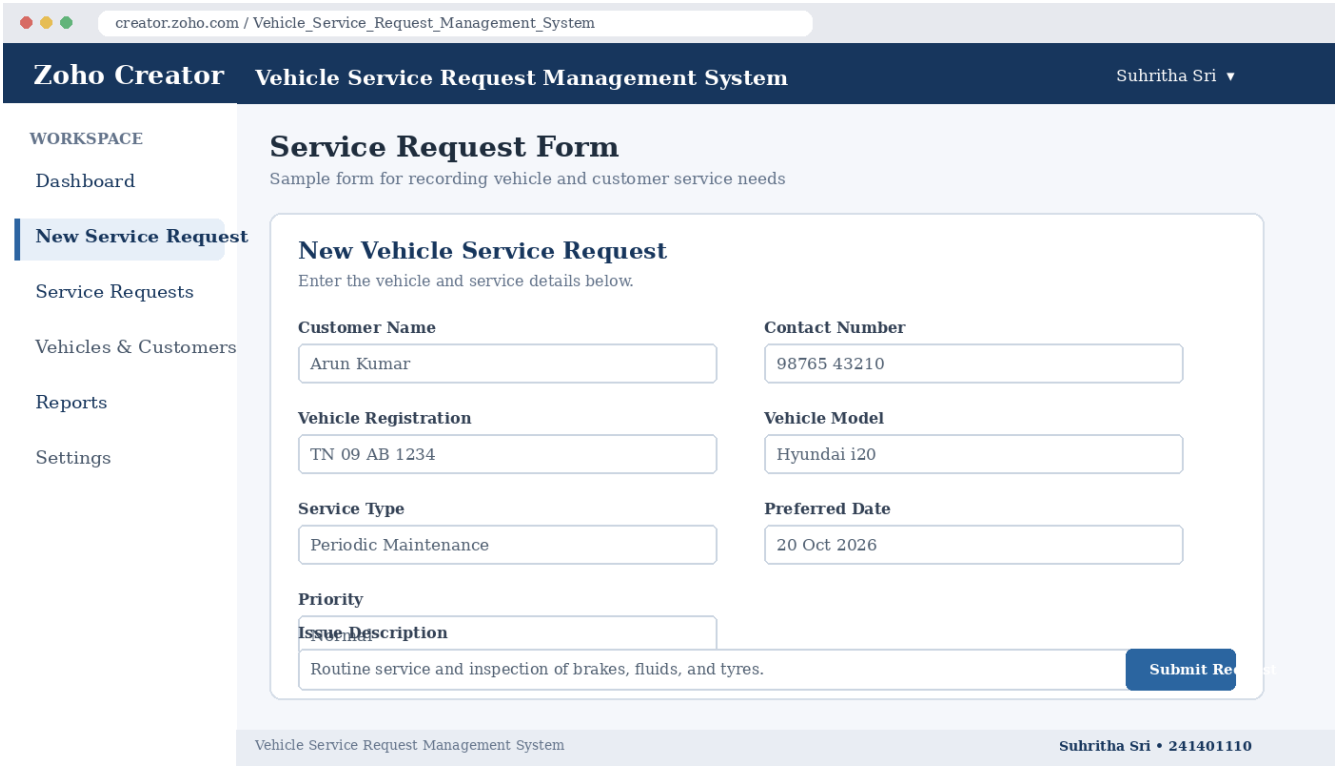

Figure 2. Vehicle service request form showing customer, vehicle, service, priority, and issue fields.

Fields represented

- Customer name and contact number.
- Vehicle registration number and model.
- Service type, preferred service date, and priority.
- Issue description and request submission action.

4. Dashboard and Service Request Report

The dashboard provides a quick view of requests that are open, in progress, completed, or awaiting review. The report view supports filtering and tracking requests using a request ID, customer name, registration number, service type, date, and status.

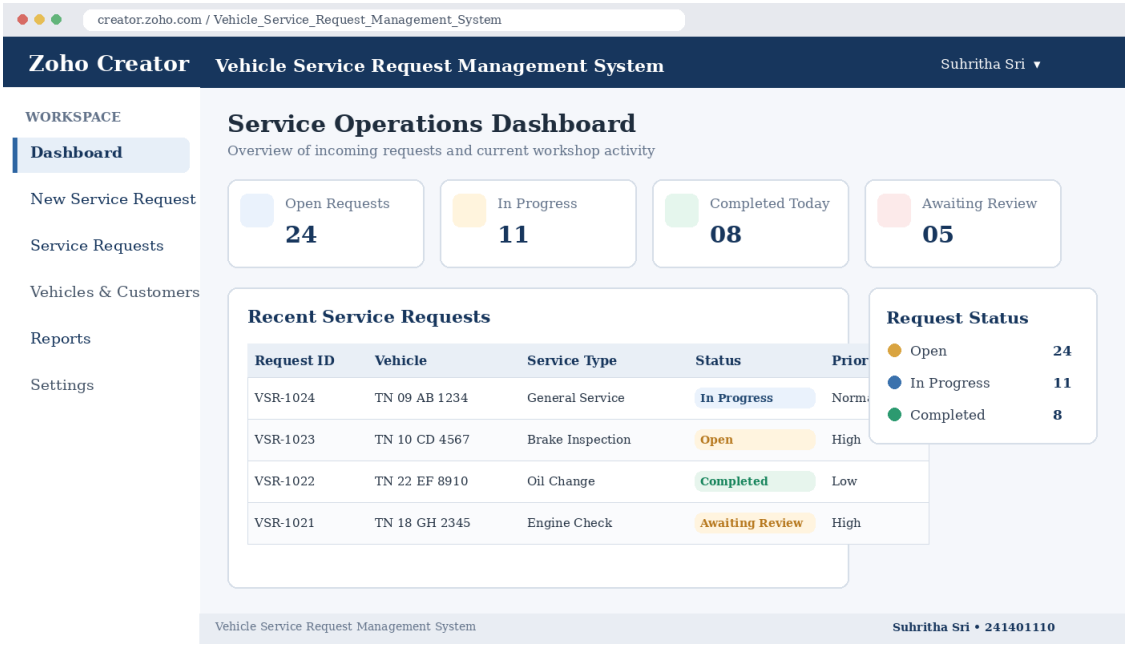

Figure 3. Illustrative service operations dashboard with request summary and recent activity.

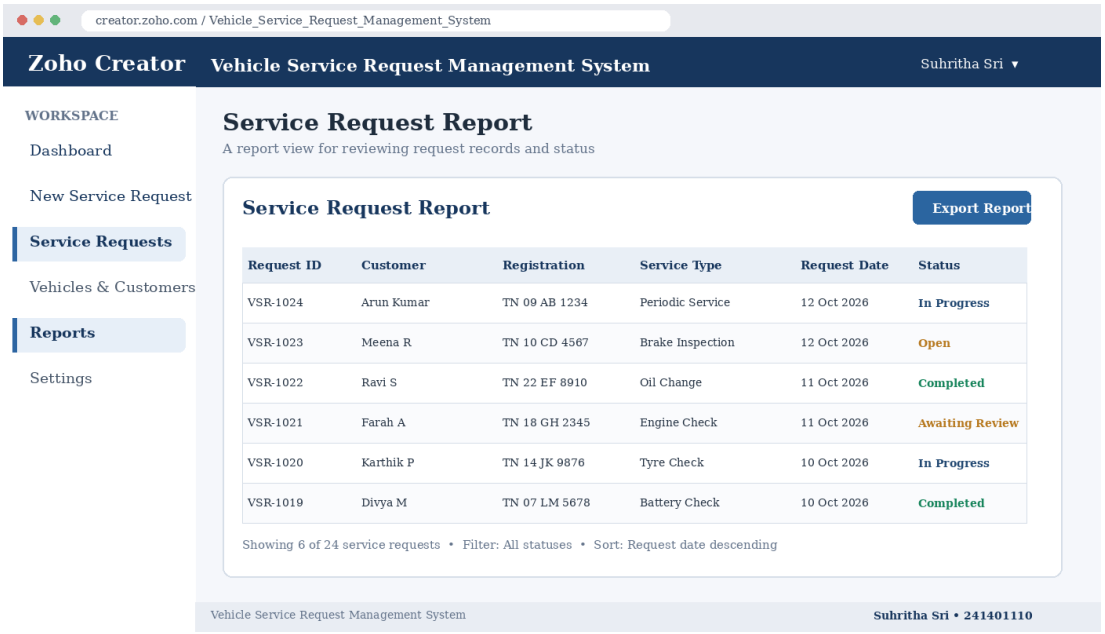

Figure 4. Illustrative service request report showing records and status values.

5. Deployment Procedure

Step 1 — Open the application.
Open the Zoho Creator workspace and locate Vehicle_Service_Request_Management_System.

Step 2 — Configure environments.
Open Deploy / Environments and add the application to the deployment workflow, if it has not already been configured.

Step 3 — Update in Development.
Make the required change to the service request form, report, or workflow in the Development environment.

Step 4 — Select components for Stage.
Use the publish-to-Stage action and select only the components that need to be reviewed.

Step 5 — Enter release details.
Provide a release title and description, choose an appropriate version type, and confirm the selected components.

Step 6 — Verify Stage.
Wait for the publish process to complete and test form submission, report visibility, and status updates in Stage.

Step 7 — Publish to Production.
After Stage review, select the approved Stage version and publish it to Production.

Step 8 — Confirm the live version.
Refresh the environment view and verify the Production version and core application functions.

6. Publishing and Production Verification

The publish process should include only reviewed changes. For this application, the selected components may include the service request form, service request report, and status workflow. The screenshots below are illustrative interface mockups to demonstrate the relevant steps.

Figure 5. Example publish-to-Stage panel listing vehicle service application components.

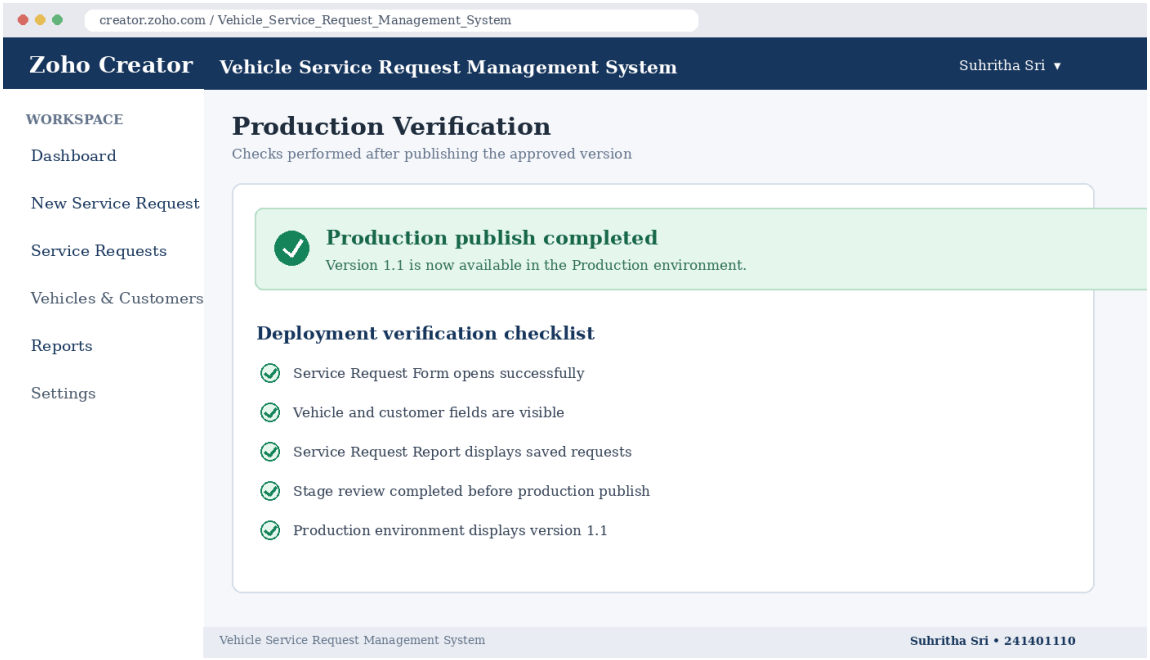

Figure 6. Example post-deployment verification checklist for the Production version.

7. Result and Conclusion

Verification Checklist

Check	Expected result
Service request form	Form opens and required fields are visible.
Vehicle/customer details	Details can be entered and saved as a request.
Service request report	Saved requests appear with correct identifying details.
Status workflow	Request status can be reviewed and updated by authorized users.
Production environment	Approved version is shown as published in Production.

Result

The deployment workflow for the Vehicle Service Request Management System was documented, covering environment setup, selection of components for Stage, pre-release verification, publication to Production, and final checks.

Conclusion

Separating Development, Stage, and Production supports safer releases and makes it easier to validate changes before service staff and vehicle owners use them. The application’s forms, reports, and status workflow should be checked after each release to confirm that the live system remains consistent with the approved version.

Note on figures: Figures 1–6 are illustrative interface mockups made for this report. Replace them with screenshots captured from your own Zoho Creator account if your instructor requires evidence of a real deployment.
