EXPERIMENT 9 - LAB RECORD

Exploring AI-Assisted Features and Built-In Analytics in Zoho Creator

Submitted by	Suhritha Sri
Register number	2414011110
Application	Vehicle_Service_Request_Form (Zoho
Platform	Creator) Zoho Creator (low-code) with Zia / Build Agent

Dashboard, Kanban report and AI assistant for the Vehicle_Service_Request_Form application

1. Aim

Toexplore thebuilt-in analytics and AI-assisted features of Zoho Creator by reviewing the vehicle service dashboard, a Kanban report and a list report, and by asking the AI assistant to suggest conditional formatting, in order to understand how service-request data becomes useful operational insight with little or no custom code.

Objectives

- Review the Vehicle_Service_Dashboard, which combines summary charts and a request report.
- Study the service-request Kanban report grouped by Service Status.
- Review the Vehicle_Service_Request_Report as the source data.
- Trythe AI assistanttoapply conditional formatting and record the result honestly.

Software and tools

- Zoho Creator with theVehicle_Service_Request_Form application
- Web browser with internet access
- Zoho account with access to Edit and Access (live) modes

2. Theory

Built-inanalytics. Zoho Creator can turn form records into summaries without a separate BI tool. A dashboard can combine charts and embedded reports; a Kanban report groups records into columns by a chosen field; and list reports show the underlying records. These views use the same application data, so changes to records are reflected in the reports.

Zia / Build Agent. The AI assistant accepts plain-language instructions about forms, reports and dashboards and may apply supported changes. If a requested change cannot be configured, the response should be checked and the change completed manually where possible

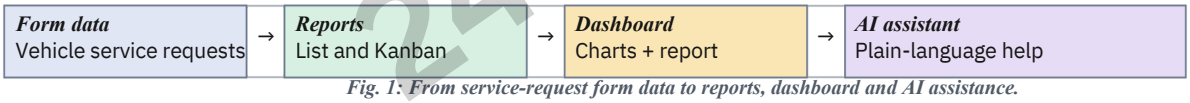

Fig. 1: From service-request form data to reports, dashboard and AI assistance.

Concept	*Meaning*
Dashboard	A page that combines charts and embedded reports into one overview of service requests.
Chart	A visual summary of records by a selected field, such as service category or status.
Kanban report	A board-style report that groups records into columns by a field such as Service Status.

Concepts and application configuration

Concept	*Meaning*
List report	A table showing the records stored in a form.
Conditional formatting	A report rule that changes the appearance of cells or rows based on values.
AI assistant / Build Agent	An assistant that accepts plain-language instructions for supported application changes.

Parameter	*Detail*
Application	Vehicle_Service_Request_Form
Form fields	Request ID, customer name, contact number, vehicle make/model, registration number, service type, priority, request date and service status.
Dashboard	Vehicle_Service_Dashboard: request summary cards, category chart and embedded request report.
Kanban report	Vehicle_Service_Kanban, with columns grouped by Service Status.
List report	Vehicle_Service_Request_Report, showing submitted service requests.

3. Procedure

1.Openthedashboard— Open the application in Access mode and select Vehicle_Service_Dashboard. Review the request summary cards, service-category chart and recent-request report displayed on the page.

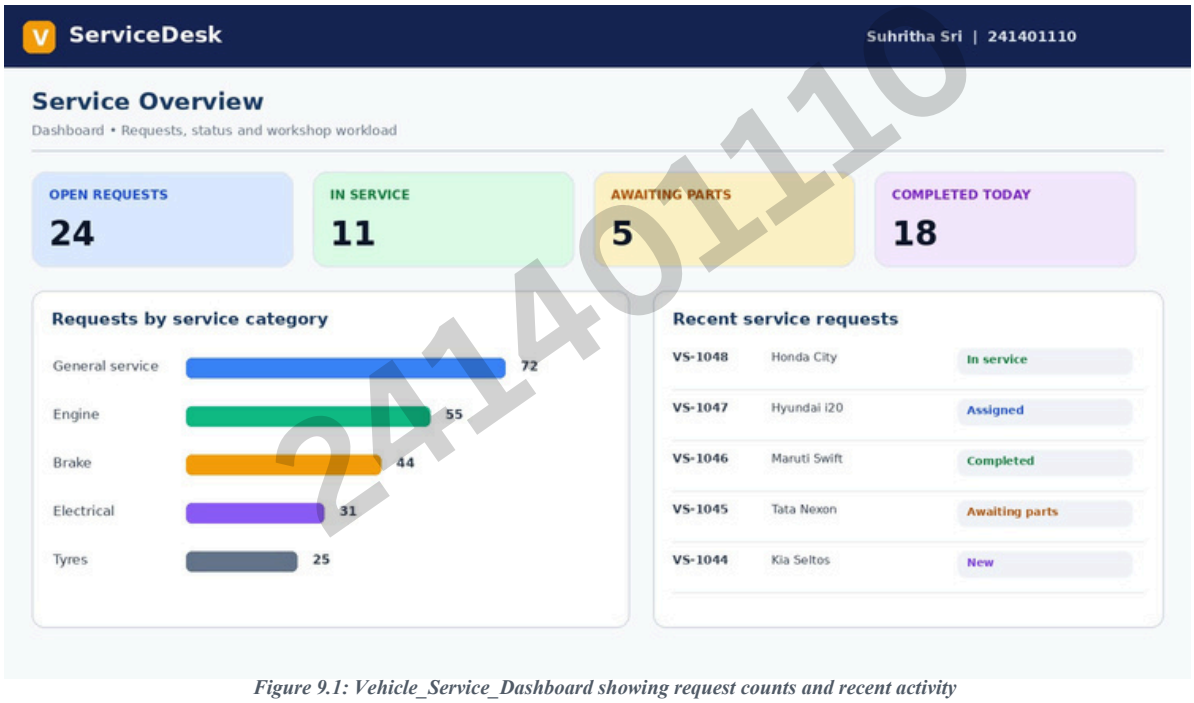

Figure 9.1: Vehicle_Service_Dashboard showing request counts and recent activity

3. Procedure (continued)

2.Checkthereportproperties— InEditmode, open Vehicle_Service_Request_Report. Review the form source, grouping field, sorting and record-count settings. The example configuration groups requests by Service Status.

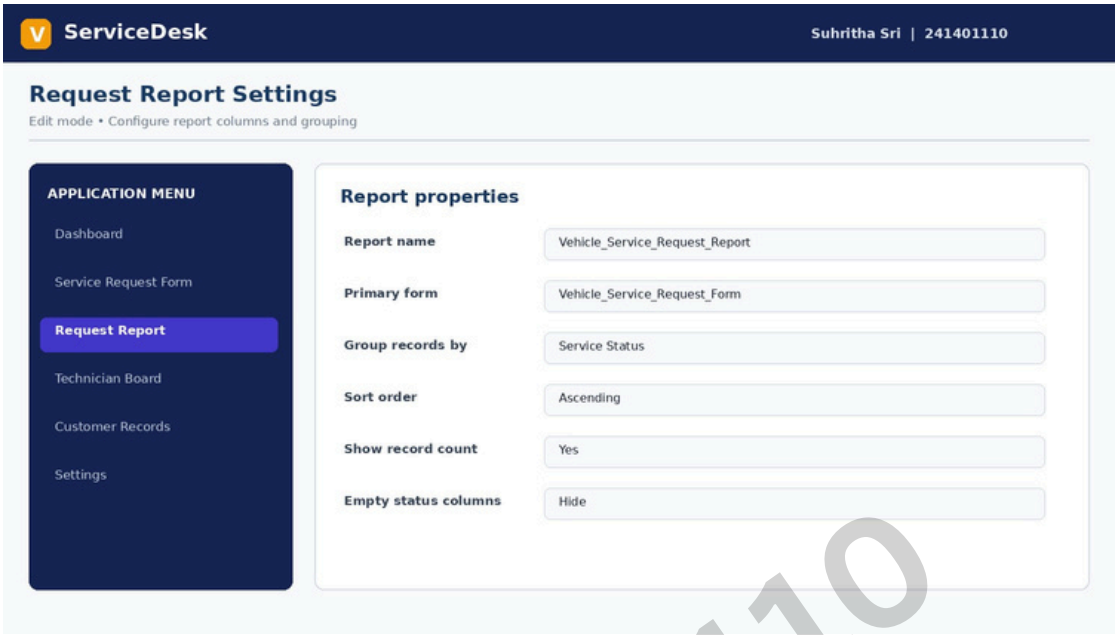

Figure 9.2: Report properties for the vehicle service request application

3. View the Kanban board — Open Vehicle_Service_Kanban in Access mode. Requests appear as cards under New, Assigned, In Service, Awaiting Parts and Completed. This layout helps staff identify the current stage of each request.

3. Procedure (continued)

4.Reviewthelistreport—Open Vehicle_Service_Request_Report. The report presents request identifiers, customer and vehicle details, service type, priority and current status. This list is the underlying record source used by the dashboard and Kanban view.

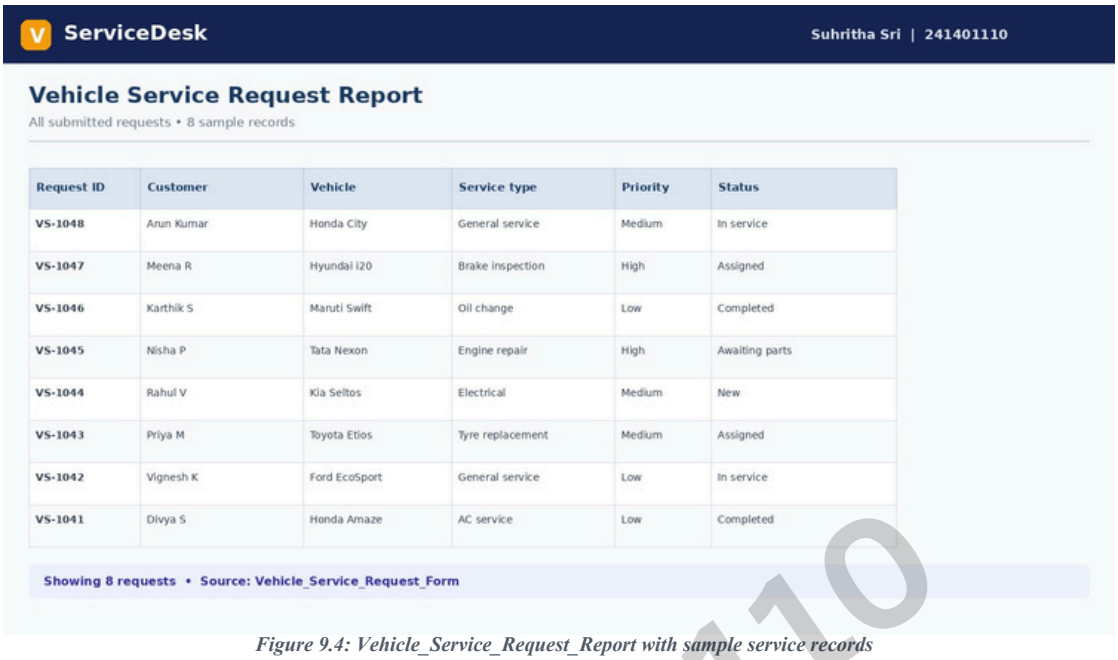

Figure 9.4: Vehicle_Service_Request_Report with sample service records

5. Ask the AI assistant to add conditional formatting — Enter a plain-language request to highlight High priority requests in red and Low priority requests in green. Check the assistant's response and verify the report before assuming the rule has been applied.

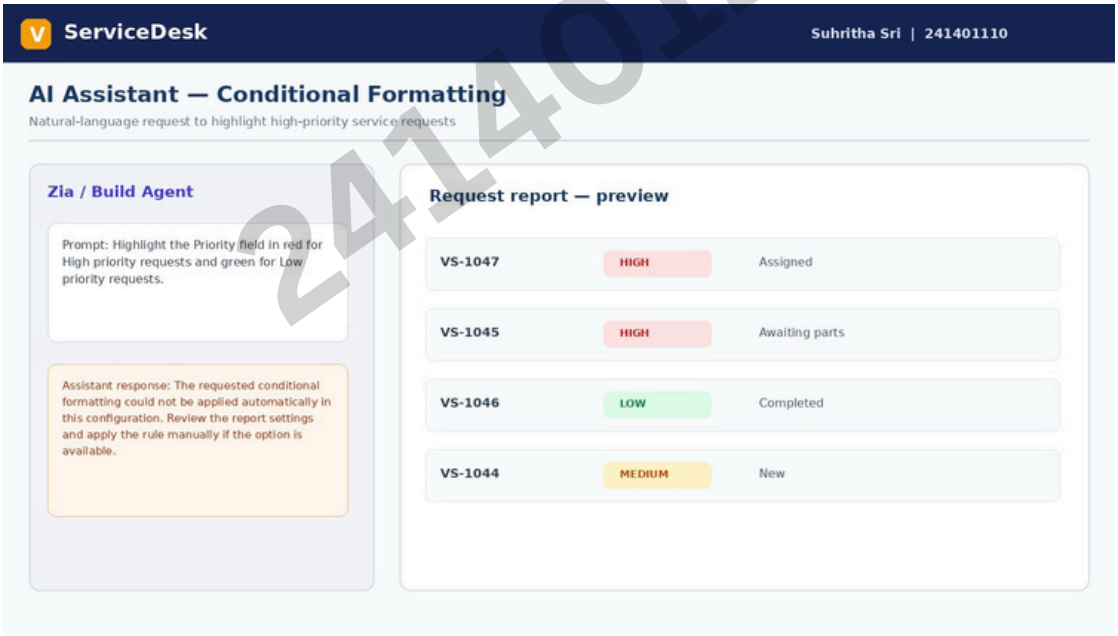

Figure 9.5: Example AI-assistant request for conditional formatting

Note: Theapplicationscreensare illustrative mock-ups, not screenshots captured from a live Zoho Creator application.

4. Observations

- The dashboard provides an overview of service-request volume and status.
- The Kanban board groups requests by status and makes the workflow stage visible.
- The list report provides detailed records used by the dashboard and board.
- AI-assisted changes should be verified; unsupported formatting requests may require manual configuration.

5. Result

Thedashboard,status-based Kanban view and underlying service-request list were reviewed. An AI-assisted conditional-formatting request was documented, with a reminder to verify the actual application response.

6. Conclusion

The experiment demonstrates how a Vehicle Service Request Management System can organize service records into a dashboard, Kanban board and list report. These views help summarize workload and track each request from submission to completion. AI-assisted configuration can simplify setup, but any change must be verified in the live application.
